percolation robustness cascading failure

> S V S M 6302 CLASS 12

Percolation

-> node (site) percolation - removing a fraction of nodet in a network (and the adjacent edges)

- edge (bond) percolation- removing a fraction of the edges in a network

Removal con represent failure / destruction/death.

Removal isn't always abad thing: Vaccination "removes" people from a contagen network

Occupation Probability P

 $\phi = 1$: no notes removed, "occupied" notes que functional

 $\phi = 0$: all nodes removed

As $\phi = 1 \rightarrow \phi = 0$, there is a percolation threshold at which point a giant component (giant cluster) dissolves.

Disease Spread

Internet

ABOVE: Epidemic!

most not con

Communicate

BELOW: disease is confined to small sections of population

Cannot reach all nodes!

PEROCATION
THRESHOLD

Percolation con be random (minicing failures)

or con be strategic, e.g. by degree (mimicing attacks)

The configuration model captures most of the major percolation properties in an analytic framework.

Low will look at them empirically through Albert 2000

Practical Percolation

-> Instead make a fixed number of nodes (F) occupied

$$P_{r} = \binom{n}{r} \phi^{r} (1-\phi)^{n-r}$$

probability that I no det are occupied given occupation probability of

$$S(\phi) = \sum_{r=0}^{n} P_r S_r = \sum_{r=0}^{n} \binom{n}{r} \phi^r (1-\phi)^{n-r} S_r$$

expected size of expected size of largest component as a function of φ as a function of φ

St+1 is a minor update from $S_{+} \rightarrow it$ involves adding one more occupied node

Couster change is minimal & with careful book keeping can be an easy update

-> A single failure can lead to successive failures -> Biochemical cascades

Lo often linked to capacities

Lo fundamentally due to an underlying process

The fundamentally due to an underlying process

Tower grids

Biochemical cascades

Finance (systemic risk)

traffic

The fundamentally due to an underlying process

The fundamentally due to an underlying process due to an underlying pro
